

# Project Plan Group 6

## 1. Project description

The goal of this project is to design and implement a distributed Vehicle-to-Infrastructure (V2I) system using a microservices architecture deployed on Kubernetes (GKE).

The system simulates assisted driving scenarios with communication between vehicle ECUs and a backend.

Project goals:

- Develop a distributed microservice system for vehicle communication
- Deploy services using containerization and orchestration (GKE)
- Implement real-time data exchange via message broker/API gateway
- Build a Storefront web application to visualize vehicle behavior
- Simulate 3 driving scenarios (constant speed, emergency braking, dynamic speed change)
- Ensure scalability, fault tolerance and modularity

Project Non-goals:

- Real vehicle integration
- Performance optimization beyond a stable demo

## 2. Project Organization Chart

| Role                                       | Name               | Backup             | Responsibilities                                           |
|--------------------------------------------|--------------------|--------------------|------------------------------------------------------------|
| <b>Backend &amp; Cloud Engineer</b>        | Lubomira Smolarova | Thomas Czech       | Kubernetes, GCP setup, message broker, database            |
| <b>Microservices Developer</b>             | Martin Resch       | Lubomira Smolarova | WHEREAMI, SONAR, BRAKENOW, UTRACKED, ORCHESTRATOR services |
| <b>Frontend &amp; Integration Engineer</b> | Thomas Czech       | Martin Resch       | Storefront UI, API Gateway                                 |

### 3. Work Breakdown Structure (WBS)

| Nr. | Task                                      | Description                                                     | Responsible (Lead) | Milestone |
|-----|-------------------------------------------|-----------------------------------------------------------------|--------------------|-----------|
| 1   | <b>Projektmanagement &amp; Planning</b>   | Create a Project Plan, Define Milestones, GCP-Budget, Git Setup | Lubomira Smolarova | M1        |
| 2   | <b>Architecture &amp; Design</b>          | Logical View & Physical View, API-Definitions, EER-Diagrams     | Lubomira Smolarova | M2        |
| 3   | <b>Infrastructure</b>                     | GCP Cluster Setup, Kubernetes                                   | Lubomira Smolarova | M3        |
| 4   | <b>Messaging Service</b>                  | Mom & Spider                                                    | Martin Resch       | M3        |
| 5   | <b>BackendServices (Data Persistence)</b> | WHEREAMI, UTRACKED                                              | Martin Resch       | M4        |
| 6   | <b>Backend Services (Logic)</b>           | SONAR, BRAKENOW, ORCHESTRATOR                                   | Martin Resch       | M4        |
| 7   | <b>Front End</b>                          | Storefront                                                      | Thomas Czech       | M4        |
| 8   | <b>Simulation</b>                         | Simulator for the 3 scenarios                                   | Thomas Czech       | M5        |
| 9   | <b>Testing</b>                            | Write Unit and Integration tests                                | Thomas Czech       | M5        |
| 10  | <b>Documentation</b>                      |                                                                 | All                | M6        |

### 4. Effort Estimation

The following table lists the estimated time, per work package. The amount of work per person is oriented on the 3 ECTS (75-90h) this course is rated. We estimate that each team member spends 85h on the project.

| WP Nr. | Time (h) |
|--------|----------|
| 1      | 15h      |
| 2      | 25h      |
| 3      | 35h      |
| 4      | 20h      |

|              |              |
|--------------|--------------|
| 5            | 25h          |
| 6            | 35h          |
| 7            | 30h          |
| 8            | 35h          |
| 9            | 20h          |
| 10           | 3x 5h        |
| <b>Total</b> | <b>=255h</b> |

## 5. Resource & Milestone Planning

### 5.1 Milestones

| ID        | Milestone            | Date (Deadline) | Description                                             |
|-----------|----------------------|-----------------|---------------------------------------------------------|
| <b>M1</b> | Project Kick-off     | 12.04.2026      | Finalization of project plan                            |
| <b>M2</b> | Design Freeze        | 26.04.2026      | Architecture & API-Spezifikation is finalised           |
| <b>M3</b> | Infrastructure ready | 10.05.2026      | GKE Cluster is operational, Message middleware is setup |
| <b>M4</b> | Feature Complete     | 24.05.2026      | Microservices & Storefront are functional               |
| <b>M5</b> | Simulation & Testing | 31.05.2026      | Scenarios & Tests are finished                          |
| <b>M6</b> | Project finished     | 07.06.2026      | All deliverables are finished and submitted via tuwel   |

### 5.2 GCP-Budget

Google Kubernetes Engine costs 0.10USD per hour, but this will be substituted for the first month.

Also an 'e2-medium' node costs 0.033 USD per hour. After also adding the external IP and estimating a low amount of disc space for the databases. It should cost around 80-100USD. This results in a buffer of 50USD.

| Item                         | Estimated Cost Range  |
|------------------------------|-----------------------|
| GKE Management Fee           | 40-80USD (0.10USD /h) |
| Storage and persistent disks | 5 USD                 |
| Network/ IP-Lease            | 5-10 USD              |
| e2-medium                    | 5 USD (0.033 USD /h)  |

## 6. Engineering Planning

- Containerization: Docker
- Orchestration: Kubernetes (GKE)
- Cloud Provider: Google Cloud Platform
- Message Broker: RabbitMQ / Cloud Pub/Sub
- Backend: C# (.Net)
- Frontend: React Framework
- Database: Firestore / Cloud SQL
- Version Control: GitHub
